

XL SPEED REDUCER

New Aero XL ATR: The best Speed Reducer to date. The bearings are now mounted in such a manner that they can easily be moved for either the 125mm or 150mm wheels. The new lever is designed so pressure is applied to both serrated roller arms for improved pressure distribution and greater durability.

For the Aero 150 the system has one neutral position and 4 resistance settings and the 125 has 3 resistance positions. The ATR functions equally well in both dry and wet conditions.

The ATR assembly is made from aluminum, stainless steel and nylon. The lever is easy to grab and pivots on solid stainless steel pins. The nylon rollers and washers are used to reduce noise generated by vibration from skiing on rough surfaces. Almost all Aero skis are sold with the speed reducer system.
